## Information Communication Technology

### Acknowledgment

Modern information and communication technology have created a "Global village"

in which place can communicate with others across the world. ICT is often discussed in the context of how

modern communication technologies affect society. Information and the communication Technology (ICT) has become a key factor in the future development of

service industry including banking, transports, logistics, and retailing influencing every aspect of human life.

They are playing role in work places, business, education, and every as entertainment. The world is changing.

As information and communication technologies offer

information communication Technologies within today's ever-changing society profoundly impacts the way we lead our lives. The effects of these pervasive

pervasive technologies present both a challenge and an opportunity for researchers, educators, and

students worldwide. The development and emergence of computer and communication technologies;

jointly termed as information and communication technologies (ICT) has affected almost all aspects of human life.

## INTRODUCTION :-

Information technology evolved in the 1970s. Its basic concept, however, can be traced to the Cold War II alliance of the military and industry in the development of electronics, computers and information theory. After the 1940s, the military remained the major source of research and development funding from the expansion of automation to replace manpower with machine power.

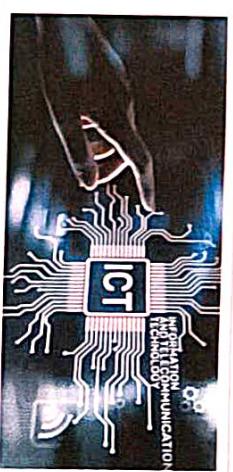

Information and communication technologies have developed since to the application of information and communication technologies (ICT) towards social, economic, and political development, with a particular emphasis on helping poor and marginalized people and communities. ICT for development is grounded in the notions of development growth, progress and globalization and is often interpreted as the use of technology to deliver a greater good.

Information and communication refers to technologies that provide access to information through Telecommunication.

## WHAT IS ICT?

The term ICT is also used to refer to the convergence of audiovisual and telephone networks with computer networks through a single link system. There are large economic incentives to merge the telephone network with the computer network system using a single unified system of cabling, signal distribution and management. Communication devices, computing, storage, television, cell phones, computer and network hardware, satellite system and so on, as well as the various services and appliance with them such as video conferencing and so on, as well as information communication technology is a common term referring to the technologies used from collecting, storing, editing and communicating information.

ICT means the use of computer based technology and the Internet to make information and communication services available in a wide range of areas. The term ICT is also used to refer to the convergence of audiovisual and telephone networks with computer networks through a single link system. Therefore large economic incentive to merge the telephone network with the computer network using a single unified system.

## Definition :-

According to the Encyclopedia of Computer Science, "Information Communication Technology (ICT) is an imprecise term frequently fundamental to broad areas of technologies and associated with the use of computers and communications".

According to UNESCO "ICT is a scientific, technological and engineering discipline, and management techniques used in handling information and socio-economic and cultural matters".

## Advantages of ICT :-

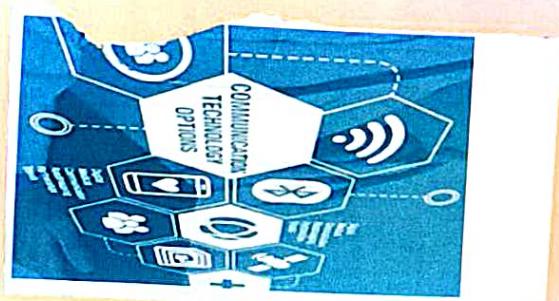

- **Globalization :-** video conferencing saves money of flights and accommodation. ICT has not only brought the countries and people closer together, but it has allowed the world economy to become a single interdependent system. To contact either a business or make them exceptionally cost effective.
- **Cost Effectiveness :-** The users can send an email and without doubt cheaper than phone calls. ICT has also helped to automate business.

- Practices, to make them exceptionally cost effective.
- **More Time:** you may have your goods delivered right to your doorstep with having to move a single muscle by clicking the items to be purchased via internet and making payment electronically.
  - **Creation of new jobs:** The best advantage of IIT has been the creation of new, active and interesting job computer programmers, system, hardware and software developers and web designers and forms of the many new employment opportunities created with help of IT.
  - **Education:** computers along with their programs and the internet have created education opportunities not available to previous generation. A degree can be completed online from person's home. it is possible to hold a job and still do degree.

## Disadvantages of IIT:

- **Blackmail:** Using the Internet to threaten to cause damage with the intent to extort from any person any money or other things of value.
- **Unemployment:** Using the computer instead of human resources, employers use, save huge amount of

TOPIC :

many but employees are losing their jobs as not needed anymore.

• **Privacy :-** Information technology may have made communication fast and more convenient, it has also brought along privacy problems. From cell phone signal interception to email hacking & about their own private information becoming public knowledge.

• **Computer viruses :-** worms, Trojans, malware spread over all can chaos and disrupt our daily lives.

• **Social media :-** they became related to the phones, IPods, gaming consoles forgetting about outside activities and communication in the society.

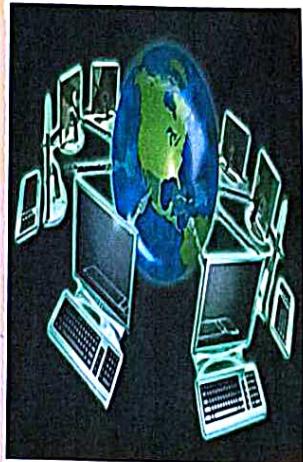

## Disadvantages of ICT —

• **Blackmail**

**Components of ICT —**

↳ **Computer Technology**

A complete highlight of computing would include a multitude of diverse devices such as the current mobile phones, laptops, desktops, etc.

## Characteristics of computer :-

- » Speed
- » Logical operations
- » Accuracy
- » Reliability
- » Storage
- » Automation
- » Versatility
- » No Jittering

2. Network Technology — Networking technology allows for the exchange of data between large and small information system used primarily by businesses and educational institutions. Networking, end-users are able to transmit files, messages and other data through e-mail or various other channels, sharing information in the through internet communication based on the needs of an organization. wireless connections to get to various data, communication and resource in different part of the world.

ARPANET - the first network.

Advanced Research Projects Agency Network.

The first standard of internet was a network established by the US Department of Defense.

DATE:

▼

**Local area network (LAN)**— LAN are the most frequently discussed networks. LANs connect group of computers and low-voltage devices together across short distances to share information and resources.

▼

**Metropolitan area network (MAN)**— It provides interconnection of networks in a city into single network.

WANs span across geographic areas typically a town or city, but sometimes a campus.

**Wide area network (WAN)**— It covers large geographical areas having state or countries.

The internet is the most basic example of WAN connecting all computers.

DATE :

TOPIC :

## Types of network in use Today :-

- 1) Personal area network
- 2) wireless local area network
- 3) campus area network
- 4) Enterprise private network

## 3) Communication Technology :-

Information and communication technology has become a revolutionary cornerstone in the education world today we also use information communication technology in our every day work.

Information communication technology in India was promoted under the national secondary education campaign which was initiated in December 2004. The world communication has its origin in the English language world communication which is made up of Latin-language communists.

Communication in Ancient Times :- The first means of communication was the human voice but about 3,200BC writing was invented in Mesopotamia.

Communication 1500-1800 :- The next major improvement in communication was the invention of printing.

The first newspaper were printed in the 17<sup>th</sup> century. The first newspaper in England was printed in 1641.

**TOPIC:**

communication in the 20<sup>th</sup> century :- communication continued in 1837. Alexander Graham Bell the 1990 new radio stations included Radio 5 live 1990 and classic FM 1991. Television was invented in 1925 by John Logie Baird and the BBC began regular, high definition broadcasting in 1936. Martin Cooper invented the first handheld mobile phone in 1973. The first mobile phone cell in Britain was made in 1985. In Britain smart phone were introduced in 1996.

Communication in the 21<sup>st</sup> century : 21<sup>st</sup> century the internet became an important form of communication. Today email has become one of the most popular methods of communication.

**Communication process** - In order to better understand the communication process;

■ **Source (sender)** - Sender or the communication generates the message and convey it to the receiver.

■ **Message** - The message or content is the information the sender wants to relay to the receiver.

All these elements together - sender, receiver and message and you have the communication process at its most basic.

■ **Media** - The medium is decided by sender.

DATE :

TOPIC :

► **Receiver** — he is the person who is last in the chain and from whom the message was sent by the Sender.

#### 4. Telecommunication —

The history of telecommunication began with use of smoke signals and drums in Africa the Americas and part of Asia 1830 that electrical telecommunication system started to appear. Telecommunication is the transmission of signs, signals message, words, writings, images and sounds or information of any nature by wire radio optical or other electromagnetic systems.

The word telecommunication comes from the Greek prefix Tele, which means distant, combined with the Latin word Communication which means to share.

Telecommunication technologies include the telegraphy, telephone, radio television video telephony, satellite closed computer networks and public internet. Early telecommunication transmission used

DATE:

analog signals which were transferred over copper wires. Today telephone and cable companies still use these same lines though most transmission are now digital. Telecommunication wiring is done with cables that are optimized for digital communication such as fiber optic cables and digital phone lines. Telecommunication is a universal term that is used for a vast range of information - transmission technologies such as mobile phones, landlines, VoIP and broadcast network.

## Types of telecommunication:-

- a) E-mail - Electronic mail is a method of exchanging message between people using electronic devices. Invented by Ray Tomlinson email first entered limited use. in the 1960 and by the mid - 1970 had taken the form now recognized as email.

DATE:

TOPIC:

b) **Fax** - The first fax machine was invented by Scottish mechanic and inventor Alexander Bain. A fax machine is a device that is used to send documents electronically over a telephone network. Today's fax machine is less frequently a stand-alone machine and more often part of a multifunction unit that also has printing, scanning, and copying features.

c) **Telephony** - Alexander graham Bell was awarded the first U.S patent for the invention of the telephone in 1876. A telephone also called Phone is a communication tool using a telephone two people who are in different places can talk to each other.

d) **Television broadcasting** - The world's first electronic television was developed by a 21 year old inventor named philo taylor farnsworth.

c) videoconferencing - The first concepts of video conferencing were developed in the 1870s, as part of an extension of audio devices.

Today video conferencing is used by many industries, including educators, marketers.

d) cell phone / mobile phone - A mobile phone is frequently called a cellular phone or cell phone. Most mobile phones provide voice communication, short message service (SMS), multimedia message service (MMS), and newer phones may also provide internet.

e) Radio

f) Telegraph

## 5. Radio communication -

Radio waves were first identified and German physicist Heinrich Hertz in 1886.

The early is the history of technology that produces and uses radio instruments that use radio waves.

## 6. Microwave communication -

Microwave technology was developed during world war II (1939-45) in connection with secret military radar research.

Today, microwave are used primarily in microwave oven and communications.

## Advantage of microwaves :-

- ⇒ Large Bandwidth - Microwaves are used for point to point communication.
- ⇒ Small size Antenna - The antenna size can be smaller as the size of antenna is inversely proportional.
- ⇒ low power consumption - As microwave have high frequency thus requires very less power.
- ⇒ Effect of fading - While at low frequency signal the layers around the earth causes fading of the signals.

## 7. Satellite communication -

A communication satellite is an artificial satellite that relays and amplifies radio telecommunication signals via a transponder ~~a communication channel~~, between a source

## Uses of satellite communication ;

- ⇒ Traditional Telecommunication
- ⇒ Cellular
- ⇒ Television Signals
- ⇒ Marine communication

## 8. Fiber optical communication -

Fiber-optical communication is a system in which information is sent from one people to another.

## Advantage of fiber optic communication:

- ⇒ Bandwidth
- ⇒ Low power loss
- ⇒ Size
- ⇒ Flexibility
- ⇒ Cost
- ⇒ Security

## Conclusion :-

Information and communication Technology (ICT) tools and techniques utilization has been spread widely in every walks of human being and all kinds of organizations.

ICT has improved well the library services then traditional one and now become the demand of the users as well as organization to fulfill the necessary requirements on time.
